

Grammars and Context Free Language

Mathematical model of Grammar

⇒ Noam Chomsky gave a mathematical model of Grammar which is effective for writing Computer languages.

⇒ The four types of Grammar according to Noam Chomsky are:

Grammar Type	Grammar Accepted	Language Accepted	Automaton
Type 0	Unrestricted Grammar	Recursively Enumerable Language	Turing Machine
Type 1	Context Sensitive Grammar	Context Sensitive Language	Linear Bounded Automaton
Type 2	Context Free Grammar	Context Free Language	Pushdown Automata
Type 3	Regular Grammar	Regular Language	Finite State Automaton

Grammar

\Rightarrow A Grammar 'G' can be formally described using 4 tuples as $G = (V, T, S, P)$ where,

V = Set of variables or Non-Terminal Symbols

T = Set of Terminal Symbols

S = Start Symbol

P = Production rules for Terminal and Non-Terminals

A production rule has the form $\alpha \rightarrow \beta$ where α and β are strings on $V \cup T$ and atleast one symbol of α belongs to V .

Example: $G = (\{S, A, B\}, \{a, b\}, S, \{S \rightarrow AB, A \rightarrow a, B \rightarrow b\})$

$V = \{S, A, B\}$

$T = \{a, b\}$

$S = S$

$P = S \rightarrow AB, A \rightarrow a, B \rightarrow b$

Es. $S \rightarrow AB$
 $\rightarrow aB$
 $\rightarrow \underline{ab}$

Derivations from a Grammar

The set of all strings that can be derived from a Grammar is said to be the Language generated from that Grammar.

Example 1: Consider the Grammar

$$G_1 = (\{S, A\}, \{a, b\}, S, \{S \rightarrow aAb, \underline{aA} \rightarrow aaAb, \underline{A} \rightarrow \epsilon\})$$

$$\begin{aligned} S &\rightarrow \underline{aAb} \\ &\rightarrow \underline{aaAbb} \\ &\rightarrow \underline{aaaAbbb} \\ &\rightarrow \underline{aaaaAbbbb} \end{aligned}$$

$$L(G_1) = \{ \underline{a^n b^n} \mid n > 0 \}$$

Example 2: $G_2 = (\{S, A, B\}, \{a, b\}, S, \{ \underline{S} \rightarrow AB, \underline{A} \rightarrow aA \mid a, \underline{B} \rightarrow bB \mid b \})$

$$\begin{aligned} \textcircled{1} \quad S &\rightarrow \underline{AB} \\ &\rightarrow \underline{aB} \\ &\rightarrow \underline{ab} \end{aligned}$$

$$\begin{aligned} \textcircled{2} \quad S &\rightarrow \underline{AB} \\ &\rightarrow \underline{aAB} \\ &\rightarrow \underline{aAbB} \\ &\rightarrow \underline{aabbb} \end{aligned}$$

$$\begin{aligned} \textcircled{3} \quad S &\rightarrow \underline{AB} \\ &\rightarrow \underline{aAB} \\ &\rightarrow \underline{aAb} \\ &\rightarrow \underline{aab} \end{aligned}$$

$$\begin{aligned} \textcircled{4} \quad S &\rightarrow \underline{AB} \\ &\rightarrow \underline{abB} \\ &\rightarrow \underline{abbb} \end{aligned}$$

$$\begin{aligned} L(G_2) &= \{ ab, a\tilde{a}b\tilde{b}, \tilde{a}b, ab\tilde{b}, \dots \} \\ &= \{ a^m b^n \mid m \geq 0 \text{ and } n \geq 0 \} \end{aligned}$$

Context Free Language

- ⇒ In formal language theory, a Context Free Language is a language generated by some Context Free Grammar.
- ⇒ The set of all CFL is identical to the set of languages accepted by pushdown Automata.

Context Free Grammar is defined by 4 tuples as $G = \{V, \Sigma, S, P\}$ where

V = Set of variables or non-terminal symbols

Σ = Set of Terminal symbols

S = Start Symbol

P = Production Rule

Context Free Grammar has production Rule of the form

$A \rightarrow \alpha$
where, $\alpha = \{VU \Sigma^*\}$ and $A \in V$

CFL - Example

⇒ For generating a language that generated equal number of a's and b's in the form $a^n b^n$, The CFG will be defined as

$$G = \{ (S, A), (a, b), (\underline{S \rightarrow aAb}, \underline{A \rightarrow aAb | \epsilon}) \}$$

$$S \rightarrow a \underline{A} b$$

$$\rightarrow \cancel{a} a a \underline{A} b b \quad (\text{by } A \rightarrow aAb)$$

$$\rightarrow a a a \underline{A} b b b \quad (\text{by } A \rightarrow aAb)$$

$$\rightarrow a a a b b b \quad (\text{by } A \rightarrow \epsilon)$$

$$\Rightarrow a^3 b^3 \Rightarrow a^n b^n$$

Method to find whether a string belongs to a Grammar or not.

- ① Start with the Start Symbol and Choose the closest production that matches to the given string.
- ② Replace the variable with its most appropriate production. Repeat the process until the string is generated or until no other productions are left.

Example: Verify whether the Grammar
 $S \rightarrow 0B|1A$, $A \rightarrow 0|0S|1AA|^{\wedge}$, $B \rightarrow 1|1S|0BB$
generates the string 00110101

$S \rightarrow 0B$ ($S \rightarrow 0B$)
 $\rightarrow 00BB$ ($B \rightarrow 0BB$)
 $\rightarrow 001B$ ($B \rightarrow 1$)
 $\rightarrow 0011S$ ($B \rightarrow 1S$)
 $\rightarrow 00110B$ ($S \rightarrow 0B$)
 $\rightarrow 001101S$ ($B \rightarrow 1S$)
 $\rightarrow 0011010B$ ($S \rightarrow 0B$)
 $\rightarrow \underline{00110101}$ ($B \rightarrow 1$)

Example: Verify whether the Grammar
 $S \rightarrow aAb$, $A \rightarrow aAb|^{\wedge}$ generates the string
aabb.
